Game developer and technical artist with shipped character art experience on Age of Empires Online, senior production work on a branded Fortnite/UEFN project, and current Unity/C# systems development focused on gameplay tools, validation, runtime evidence, and AI-assisted production workflows.

SELECTED TECHNICAL EVIDENCE

- Designed controlled AI-assisted Unity workflow: agent instruction files, system maps, prompt queues, validation ledgers, production-pass briefs, and source ownership rules so generated changes stay bounded and reviewable.
- Implemented Unity editor/runtime infrastructure including sync pipelines, live-scene validation runners, screenshots, JSON reports, runtime operator hooks, observation exporters, and validation scans.
- Built gameplay-facing C# systems across modular creature definitions, visual part assembly, inventory, scanning, carry/drop interactions, task routing, camera/control surfaces, UI safe frames, audio cues, combat simulation, and progression gates.

CORE SKILLS

Gameplay / Unity	Unity, C#, gameplay systems, runtime simulation, UI/HUD, input, state machines, progression, combat prototypes, save/load, data-driven tuning, UEFN/Verse
Tools / Automation	Unity editor tooling, sync pipelines, live-scene validation, JSON reports, source maps, deterministic reports, Python scripts, Git workflows
AI-Assisted Production	Codex, Claude Code, ChatGPT, Cursor, prompt queues, agent handoff docs, review gates, runtime evidence, AI-maintainable architecture
Game Art / Tech Art	Low-poly character production, topology, UVs, hand-painted textures, silhouette readability, Photoshop, 3ds Max, Maya, Blender, ZBrush

EXPERIENCE

Independent Unity/C# Gameplay Systems and Tools Development

11/2025 - Present

Self-directed

Remote

- Built Unity architecture that combines playable game systems with agent-assisted workflows: source maps, prompt queues, validation scripts, generated evidence, and strict runtime/editor boundaries.
- Created gameplay and tool systems for current Unity prototypes, including playable loops, modular character assembly, day/night and lifecycle logic, inventory/progression, UI surfaces, runtime evidence, and C# editor tools.
- Used AI tools to cut pipeline friction without surrendering engineering judgment: tasks are scoped through ownership maps, validation gates, logs, and reviewable reports before changes are accepted.

Engineering Lead / Creative Director

10/2024 - 10/2025

Loot Foundry Ltd.

Remote

- Led engineering direction for He-Man Heroes, a branded Fortnite/UEFN custom map built for Mattel's Masters of the Universe franchise.
- Designed and implemented UEFN/Verse gameplay systems for character stats, progression, conditional effects, buffs/debuffs, state-driven behaviors, and reusable runtime logic.
- Translated ambiguous design goals into specs, task flows, dependencies, implementation instructions, and production tradeoffs across design, UX, art, debugging, and delivery.

Technical Generalist / Independent Developer

2015 - 2023

Self-directed systems research

Remote

- Transitioned from production art into Unity/C# engineering by building prototypes, gameplay loops, state machines, player controllers, UI flows, data structures, and custom tools from scratch.

3D Character Artist

12/2012 - 12/2014

Gas Powered Games / Microsoft

Redmond, WA

- Contributed character art production to Age of Empires Online; modeled and textured low-poly stylized characters with strong silhouette readability, clean topology, UV efficiency, hand-painted texture discipline, and tight 264-460 triangle budgets.

EDUCATION

BFA, Media Arts and Animation - The Art Institute of Seattle, 2006 - 2010
