

Ryan Sharr

AI Assisted Development Engineer / AI Workflow Systems Engineer

hello@ryansharr.com Remote, US [Workflow archive: ryansharr.com](#) [LinkedIn: linkedin.com/in/ryan-sharr](#)

SUMMARY

AI assisted development engineer building structured workflows for coding agents like Codex, Claude Code, and Cursor. I design project environments where AI works through scoped tasks, project rules, system maps, validation checks, evidence logs, and documentation updates instead of loose prompt-to-code guessing.

Background in Unity/C#, UEFN/Verse, gameplay systems, simulation tooling, and runtime architecture. Current focus is moving quickly from vague idea to working prototype while keeping output reviewable, testable, and maintainable.

CORE SKILLS

AI Assisted Development	Codex, Claude Code, Cursor, ChatGPT, Gemini, coding-agent workflows.
Workflow Engineering	Task queues, scoped execution, project rules, system maps, doctrine files, evidence logs.
Validation	Compile checks, parser checks, runtime logs, screenshot evidence, implementation reports.
Automation and Tooling	Unity editor tools, generated asset workflows, JSON, scripting, source-of-truth enforcement.
Software Systems	C#, JavaScript, Python scripting, Unity, UEFN/Verse, Git, runtime architecture.

SELECTED AI WORKFLOW WORK

- Controlled AI Development Workflow**
Repo-structured workflow for Codex-assisted software development
 - Converted vague human requests into scoped queue items with owners, acceptance criteria, and evidence requirements.
 - Used project rules, system maps, doctrine files, and script contracts to control what Codex reads and changes.
 - Recorded validation, implementation reports, evidence logs, and documentation updates so future sessions inherit context.

- Foundation Seed / Plant Workflow**
Reusable project structure for AI assisted development across complex projects
 - Separated reusable workflow structure from project-specific implementation state.
 - Used queues, doctrine, system maps, logs, generated-file boundaries, and validation expectations to guide AI assisted work.
 - Built the system around the principle that the prompt starts the work, but the project controls the work.

- Rapid AI Prototype Development**
Vague idea to working software through AI-assisted implementation and review
 - Converted ambiguous requests into working software demos, structured workflows, and reviewable outputs.
 - Built browser and Unity prototypes with documentation, validation notes, and visible system behavior.
 - Used AI tools to accelerate implementation while preserving human review, system ownership, and debugging visibility.

SYSTEMS ENGINEERING BACKGROUND

- Unity, UEFN, Gameplay, Tools, and Runtime Systems**
Supporting engineering depth for complex runtime systems and AI assisted implementation.
 - Built gameplay and simulation systems across Unity/C#, UEFN/Verse, and interactive prototypes.
 - Designed runtime systems for stats, conditions, buffs/debuffs, AI behavior, traversal, input, UI, physics, rendering, and generated assets.
 - Led UEFN gameplay systems work at Loot Foundry, translating design and art goals into structured runtime systems under production constraints.

- Production Art and Pipeline Background**
Production background that informs tools, rendering, content pipelines, and gameplay systems.
 - Worked as a 3D Character Artist at Gas Powered Games on Age of Empires Online.
 - Built production-ready character assets within technical constraints.

EXPERIENCE

Self Directed AI Workflow and Systems Development	Built AI assisted development workflows, Unity/C# systems, prototypes, validation processes, and documentation.
Engineering Lead / Creative Director, Loot Foundry	Technical direction, systems design, creative production, team and project leadership.
3D Character Artist, Gas Powered Games	Production art background that informs later tools, rendering, pipeline, and gameplay systems work.
